

MAX Wireless Relay FOR PRO SERIES

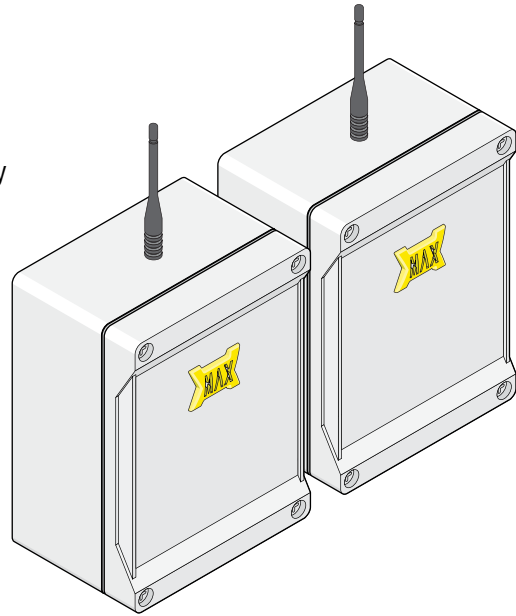

The MAX wireless relay is designed to wirelessly transmit and receive a signal from the gate operator to control desired functions remotely.

The 2 individual relays function independently from each other allowing 2 different applications to be used and they can vary greatly. Almost any device with a dry contact input (switch ON or OFF) can be used. A few examples are:

- Opening Device
- Gate Tamper monitoring and controlling
- Monitor the gate Open and Closed positions
- Turn on safety devices when the gate opens
- Operate with an existing alarm system

The 900 MHz signal is long range (up to a mile away) and robust, making the signal almost immune to any interference.
